

## 1. Corporate data

### Status and development of the company Establishment

Fogelberg & Partner GmbH was founded in 1992.

The company owns all development and distribution rights for NetPhantom® and NetPhantomX® software. Its development laboratory has been located in Sophia Antipolis, France since 2005.

### Partnerships

In addition to proprietary development of its NetPhantom product, the company has had a partnership agreement with Software AG for the product NetPhantomX since 2005.

Further partnerships exist with IBM, sd&m (a subsidiary of Capgemini), and others.

## 2. Products and services

### Fields of activity

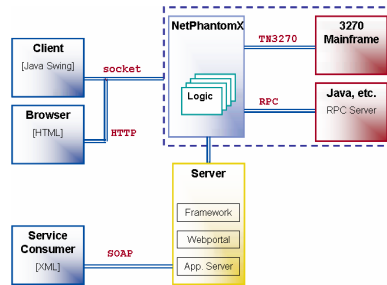

Fogelberg & Partner markets its own products NetPhantom and NetPhantomX.

It focuses on training, support, and consulting on the topics of integration and GUI-fication, as well as on application consulting for use on the Internet and in service-oriented architectures (SOA).

### Products

NetPhantom's domain is front-end integration, for which the 3270 and 5250 data stream from the host computer is used as a programmatic interface. Existing applications are modernized via graphical user interfaces (GUI) and they are provided with interfaces to all current software architectures—without any interference with the application's code (wrapping).

NetPhantomX expands the application spectrum to any back-end system. As integration servers, the tools form the hub in a server-centric IT landscape. Numerous integration interfaces for host systems, graphic clients, and programmatic interfaces for external application servers play a role here.

NetPhantomX® architecture

The servers have their own terminal component for host sessions (TN3270E/TN5250). The connector API conveniently helps provide and integrate customized adaptors. NetPhantom is the central runtime environment for GUI processing and functional add-ons, and it also has its own Web server components.

Either a compact applet for a Java Swing-based client (approx. 400 KB) or a native browser interface (HTML) serve as a communication and operation interface. Additional interfaces permit integration into Web portals as well as external Java frameworks. All current J2EE standards are supported.

Both the client applet and the application server are native Java products and therefore completely platform-independent, requiring only a Java Virtual Machine.

There is no need for traditional emulation.

### Consulting

Customers are supported in all phases of a project. The project teams receive professional support onsite from experienced technical consultants. This also includes strategic consulting and support in introducing NetPhantom. Key topics include designing the front end and all issues relating to front-end and back-end integration.

### Training

Fogelberg & Partner offers introductory training sessions for its products as well as further training and quality assurance for specific projects.

### Support

Customers are provided with onsite project support as well as hotline support.

### Customers

Our products are in use at many banks and insurance companies as well as in industry and public administration. Our customers include the following:
